

Efficient Conversion of CO₂ to Protein at Semi-industrial Scale

Presenter: Dr.Reza Ranjbar-CPI-UK

CPI has developed a technology for conversion of CO₂ to food protein in semi-industrial scale. This technology can bring sustainable food independent from location and climate. The produced protein has >1000 times lower water footprint than plant based proteins and productivity per hectare is more than 200 times higher than plant based proteins. In this presentation all steps from strain selection to production at 750L system will be presented.
